CEE 680: Water Chemistry

Lecture #49
Redox Chemistry: Predominance Diagrams;
spanning the range of pe
(Stumm & Morgan, Chapt.8)
Benjamin; Chapter 9

David Reckhow CEE 680 #49 1

Chlorine Predominance Diagram

- Features
 - Oxidation state
 - Higher oxidation states (HOCl/OCl⁻) in upper region
 - Middle oxidation state (Cl₂) in middle at low pH range
 - Chloride in lower region
 - pH divisions
 - Vertical lines at pK_a values

David Reckhow CEE 680 #48 2

Constants

- Conversions

$$pe^{\circ} [= p\varepsilon^{\circ}] = \frac{1}{n} \log K = \frac{1}{0.059} E_H^{\circ} (\text{volts})$$

$$0.059 = \frac{RT \ln(10)}{F}$$

Reaction	Log K	pe°	pe°(W)	E _H ^o , mV
NO ₃ ⁻ + 2e ⁻ + 2H ⁺ ↔ NO ₂ ⁻ + H ₂ O	28.57	14.29	7.28	843
NO ₃ ⁻ + 8e ⁻ + 10H ⁺ ↔ NH ₄ ⁺ + 3H ₂ O	119.08	14.89	6.14	878
NO ₃ ⁻ + 8e ⁻ + 9H ⁺ ↔ NH ₃ (aq) + 3H ₂ O	109.83	13.73	5.85	809
NO ₃ ⁻ + 3e ⁻ + 4H ⁺ ↔ NO(g) + 2H ₂ O	48.40	16.13	6.80	952
2NO ₃ ⁻ + 10e ⁻ + 12H ⁺ ↔ N ₂ (g) + 6H ₂ O	210.34	21.03	12.63	1241
NO ₂ (g) + 2e ⁻ + 2H ⁺ ↔ NO(g) + H ₂ O	53.60	26.80	19.80	1581
N ₂ O(g) + 2e ⁻ + 2H ⁺ ↔ N ₂ (g) + H ₂ O	59.79	29.89	22.89	1764
SO ₄ ²⁻ + 8e ⁻ + 9H ⁺ ↔ HS ⁻ + 4H ₂ O	33.68	4.21	-3.67	248
SO ₄ ²⁻ + 8e ⁻ + 10H ⁺ ↔ H ₂ S(aq) + 4H ₂ O	40.67	5.08	-3.67	299
SO ₄ ²⁻ + 2e ⁻ + 2H ⁺ ↔ SO ₃ ²⁻ + H ₂ O	27.16	13.58	6.58	801
SeO ₄ ²⁻ + 2e ⁻ + 4H ⁺ ↔ H ₂ SeO ₃ + H ₂ O	36.32	18.16	4.16	1071
H ₃ PO ₄ + 2e ⁻ + 2H ⁺ ↔ H ₂ PO ₃ + H ₂ O	-10.10	-5.05	-12.05	-298
AsO ₄ ³⁻ + 2e ⁻ + 2H ⁺ ↔ AsO ₃ ³⁻ + H ₂ O	5.29	2.64	-4.36	156
CrO ₄ ²⁻ + 3e ⁻ + 8H ⁺ ↔ Cr ³⁺ + 4H ₂ O	77.00	25.66	7.00	1514
OCN ⁻ + 2e ⁻ + 2H ⁺ ↔ CN ⁻ + H ₂ O	-4.88	-2.44	-9.44	-144
2H ⁺ + 2e ⁻ ↔ H ₂ (g)	0.00	0.00	-7.00	0
2H ⁺ + 2e ⁻ ↔ H ₂ (aq)	3.10	1.55	-5.45	92
O ₂ (g) + 4H ⁺ + 4e ⁻ ↔ 2H ₂ O	83.12	20.78	13.78	1226
O ₂ (aq) + 4H ⁺ + 4e ⁻ ↔ 2H ₂ O	86.00	21.50	14.50	1268
O ₂ (aq) + 2e ⁻ + 2H ⁺ ↔ H ₂ O ₂ (aq)	26.34	13.17	6.17	777
H ₂ O ₂ (aq) + 2e ⁻ + 2H ⁺ ↔ 2H ₂ O	39.59	19.80	12.80	1738
O ₂ (g) + 2e ⁻ + 2H ⁺ ↔ O ₂ (g) + H ₂ O	70.12	35.06	28.06	2069
Cl ₂ (aq) + 2e ⁻ ↔ 2Cl ⁻	47.20	23.60	23.60	1392
ClO ₃ ⁻ + 6e ⁻ + 6H ⁺ ↔ Cl ⁻ + 3H ₂ O	147.02	24.50	17.50	1446
HOCl + 2e ⁻ + H ⁺ ↔ Cl ⁻ + H ₂ O	50.20	25.10	21.60	1481
ClO ₂ + 5e ⁻ + 4H ⁺ ↔ Cl ⁻ + 2H ₂ O	126.67	25.33	19.73	1495
ClO ₂ ⁻ + 4e ⁻ + 4H ⁺ ↔ Cl ⁻ + 2H ₂ O	109.06	27.27	20.26	1609
HOBr + 2e ⁻ + H ⁺ ↔ Br ⁻ + H ₂ O	45.36	22.68	19.18	1338
2HOBr + 2e ⁻ + 2H ⁺ ↔ Br ₂ (aq) + 2H ₂ O	53.60	26.80	20.27	1581
BrO ₃ ⁻ + 6H ⁺ + 6e ⁻ ↔ Br ⁻ + 3H ₂ O	146.1	24.35	17.35	1437
Al ³⁺ + 3e ⁻ ↔ Al(s)	-85.71	-28.57	-28.57	-1686
Zn ²⁺ + 2e ⁻ ↔ Zn(s)	-25.76	-12.88	-12.88	-760
Ni ²⁺ + 2e ⁻ ↔ Ni(s)	-7.98	-3.99	-3.99	-236
Pb ²⁺ + 2e ⁻ ↔ Pb(s)	-4.27	-2.13	-2.13	-126
Cu ²⁺ + e ⁻ ↔ Cu ⁺	2.72	2.72	2.72	160
Cu ²⁺ + 2e ⁻ ↔ Cu(s)	11.48	5.74	5.74	339
Fe ³⁺ + e ⁻ ↔ Fe ²⁺	13.03	13.03	13.03	769
Hg ₂ ²⁺ + 2e ⁻ ↔ 2Hg(l)	26.91	13.46	13.46	794
Ag ⁺ + e ⁻ ↔ Ag(s)	13.51	13.51	13.51	797
Pb ²⁺ + 2e ⁻ ↔ Pb ²⁺	28.64	14.32	14.32	845
2Hg ²⁺ + 2e ⁻ ↔ Hg ₂ ²⁺	30.79	15.40	15.40	908
MnO ₂ (s) + 2e ⁻ + 4H ⁺ ↔ Mn ²⁺ + 2H ₂ O	41.60	20.80	6.80	1227
Mn ³⁺ + e ⁻ ↔ Mn ²⁺	25.51	25.51	25.51	1505
MnO ₄ ⁻ + 5e ⁻ + 8H ⁺ ↔ Mn ²⁺ + 4H ₂ O	127.82	25.56	14.36	1508
Co ³⁺ + e ⁻ ↔ Co ²⁺	33.10	33.10	33.10	1953

A highly oxidized system

- Chlorine species
 - +I, o and -I oxidation states

Stumm & Morgan, 1996; Fig. 8.11, pg. 463

Chlorine Predominance Diagram

- Features
 - Oxidation state
 - Higher oxidation states (HOCl/OCl-) in upper region
 - Middle oxidation state (Cl₂) in middle at low pH range
 - Chloride in lower region
 - pH divisions
 - Vertical lines at pK_a values

Iron phases

CARBONATE, HALIDE, SULFATE, SULFIDE MINERALS

307

- From Soil Science Literature
 - Pyrite is FeS₂
 - Goethite is FeO(OH)
 - Jarosite is $KFe^{3+}_3(OH)_6(SO_4)_2$

Fig. 6-16. A pH-pe diagram of pyrite, jarosite, amorphous Fe(OH)₃, goethite, and soluble components at 0.1 MPa total pressure and 25 °C. The activities of solution species are: (Fe²⁺) + (Fe³⁺) = 10⁻⁴, (SO₄²⁻) = 5 × 10⁻³, and (K⁺) = 5 × 10⁻⁴. Shaded areas represent solid phases. (Diagram after van Breeman, 1982; thermodynamic values for boundaries from Lindsay, 1979).

CEE 6

Iron redox system

- Ferrous – Ferric
 - hydroxides

Stumm & Morgan, 1996;
Fig. 8.8, pg. 461

David Reckhow

CEE 680 #49

7

Iron (cont.)

- $Fe_T = 10^{-5} M$
- No carbonates

From: [Aquatic Chemistry Concepts](#),
by Pankow, 1991 (pg 535)

David Reckhow

CEE 680 #49

8

Iron (cont.)

- Same as previous, but pH axis limited to 14

From: [Aquatic Chemistry Concepts](#), by Pankow, 1991 (pg. 536)

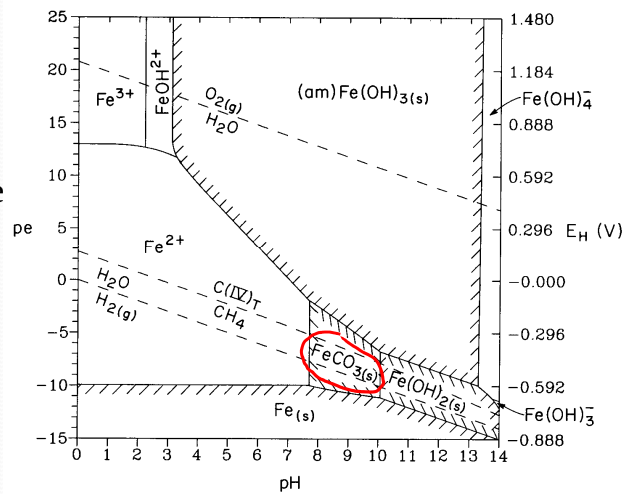

David Reckhow

CEE 680 #49

9

Iron (cont.)

- $Fe_T = 10^{-5} M$
- $10^{-3} M$ carbonate

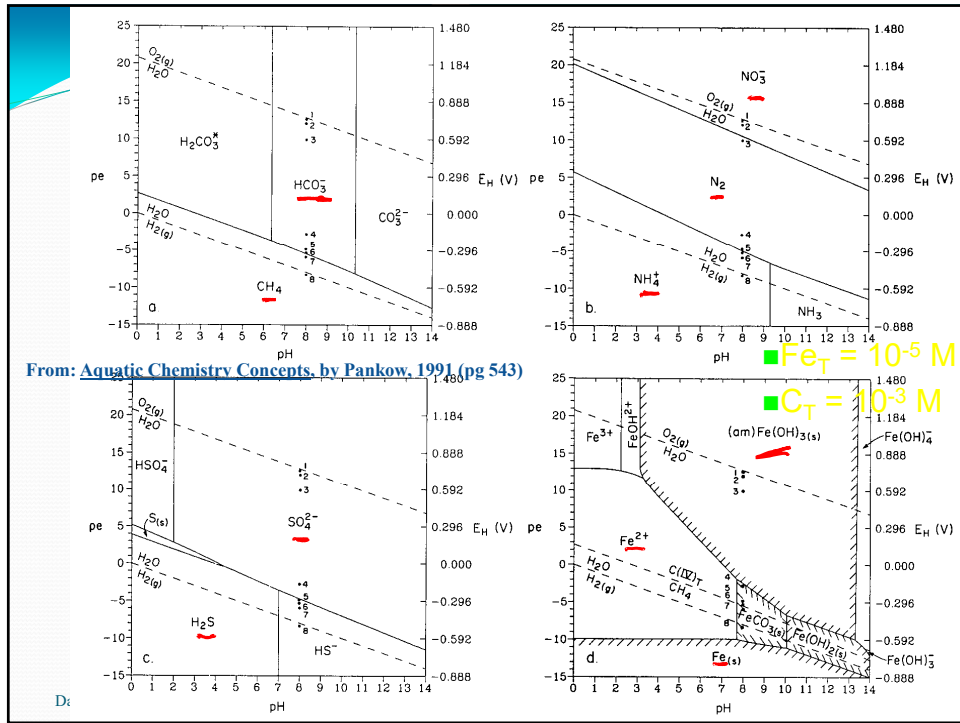

From: [Aquatic Chemistry Concepts](#), by Pankow, 1991

10

Fully oxygenated to anaerobic

- pe = 12.6.** In-situ $p_{O_2} = 0.21$ atm. At equilibrium, the dissolved oxygen will be present as O_2 (and a great deal more of H_2O). Since significant dissolved O_2 will be present, the initial pe is fairly high. The carbon, nitrogen, and sulfur will initially be present primarily as HCO_3^- , NO_3^- , and SO_4^{2-} , respectively. $(am)Fe(OH)_{3(s)}$ will be present. The in-situ p_{H_2} will be exceedingly low.
- pe = 12.1.** As the pe is reduced, the first electron acceptor (oxidant) to be reduced in large amounts (but not exclusively) will be the dissolved O_2 , which will be converted to more H_2O . By the time pe = 12.1, the in-situ p_{O_2} will have been reduced to 0.0021 atm.
- pe = 10.0.** When essentially all of the O_2 is exhausted, the next electron acceptor to be reduced in large amounts will be the NO_3^- , which will be converted primarily to N_2 . Once the pe drops to 10, the dominant nitrogen species will be N_2 .
- pe = -2.8.** After most of the NO_3^- has been exhausted, the next electron acceptor to be reduced in large amounts will be the Fe(III). Indeed, once the pe drops to -2.8, $(am)Fe(OH)_{3(s)}$ is no longer present, and we are inside the $FeCO_{3(s)}$ region. Since $Fe_T \ll C_T$, most of the carbon is still present in solution; in solution, we still have $C(IV)_T \approx 10^{-3} M$.

From: [Aquatic Chemistry Concepts, by Pankow, 1991](#)

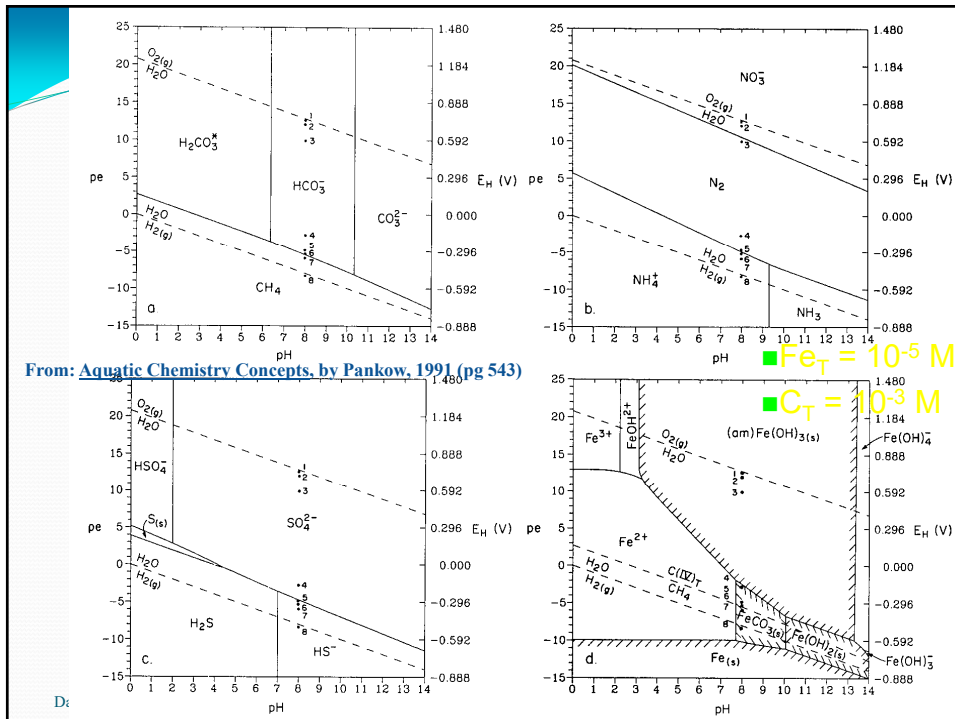

5. $pe = -4.9$. After most of the Fe(III) has been exhausted, the next electron acceptor to be reduced in large amounts will be the SO_4^{2-} which will be converted primarily to HS^- . However, since the N_2/NH_4^+ and HCO_3^-/CH_4 boundaries are only slightly below the SO_4^{2-}/HS^- boundary, as SO_4^{2-} begins to accept electrons in significant amounts, N_2 and HCO_3^- will also begin to accept some electrons. Once the pe reaches -4.9 , the dominant sulfur species will be HS^- ; N_2 and HCO_3^- will still be the dominant nitrogen and carbon species, respectively, but significant conversion to NH_4^+ and CH_4 will also have taken place. With $C(IV)_T$ still close to $10^{-3} M$, $FeCO_{3(s)}$ would still be present if it were not for the fact that there was so much sulfur in this system. Indeed, since $FeS_{(s)}$ is very insoluble, at $pe = -4.9$ the $FeCO_{3(s)}$ will have been converted to $FeS_{(s)}$.
6. $pe = -5.3$. Once the pe reaches -5.3 , we drop below the N_2/NH_4^+ line, and NH_4^+ will become the dominant nitrogen species. HCO_3^- will still be the dominant carbon species, but significant amounts of CH_4 will by now also be present.
7. $pe = -6.0$. Once the pe reaches -6.0 , we are below the HCO_3^-/CH_4 line, and CH_4 is the dominant carbon species. The bulk of the Fe is present as $FeS_{(s)}$. The level of dissolved Fe(II) is very low and the level of dissolved Fe(III) is exceedingly low.
8. $pe = -8.4$. If the pe continues to be lowered, the last major electron acceptor in the system will be H_2O . Once the pe drops below 8.4 , p_{H_2} will be greater than 1 atm. Since we are still above the line given by Eq. (23.119), $Fe_{(s)}$ is not present.
