# **CEE 697z** *Organic Compounds in Water and Wastewater*

PPCP Analysis October 27, 2014 Lecture given by Kaoru Ikuma, Ph.D.

### EPA Method 1694

 Pharmaceuticals and personal care products in water, soil, sediment, and biosolids by HPLC/MS/MS

Four analytical groups

### The Analytical Chain of LC/MS

**Sample Treatment** 

**Separations** 

**Ionization/Interfaces** 

**Mass Analysis** 

**Data/Interpretation** 

# **Step 1 Sample treatment: Extraction**

# **Solid Phase Extraction**

- Extraction of organic contaminants from water and adsorb onto solid phase to concentrate
- Sample pretreatment method used to quantitatively analyze contaminants with Liquid Chromatography/Mass Spectroscopy
- Solid phase contained in cartridges or barrels

# **Extraction Technologies**

- Off-line Solid-Phase Extraction (liquids)
  - Cartridges (syringe, sep-pak)
  - Disks
  - 96-well plates
  - Solid-phase microextraction
- On-line Solid-Phase Extraction (liquids)
  - Prospekt cartridges
  - Accelerated Solvent Extraction (solids)
    - Sorbents?

# **Solid-Phase Extraction**

- Many Types of Materials
- C2-18 on Silica backbone with varying linkages
- Polymers also with hydrophillic-lipophilic functional groups
- Anion Exchange (WC, SC, WA, SA)
- Mixed Mode
- Immunnoaffinity
- Many manufacturers

### **SPE Example**

60 mg HLB Condition: 2 mL MeOH 3 mL 0.5 N HCI  $1 \text{ mL H}_2\text{O}$ 

Load Sample

Wash: 1 mL water

Elute: 5 mL MeOH into test tube

Concentrate: N2 to 125 µL

Analyze:

CEE 697z - Lecture #21

# Typical Concentration Factors: Environmental SPE

Sample <u>Vol. (ml)</u> 100 1,000

Extract <u>Vol. (µL)</u> 100 500-1000 Concentration Factor 1000 1000-2000

1 µg/L

1-2 mg/L

# Off-line Manual SPE Method

- 500 mL to 1000 mL sample size concentrated to 1 mL One-time use HLB extraction cartridges 6 hour extraction method time
- 16 min instrument run time
- Prior to LC/MS/MS

### The Analytical Chain of LC/MS

#### **Sample Treatment**

# High performance liquid chromatography (HPLC)

http://en.wikipedia.org/wiki/Chromatography

### **HPLC Instrument Basics**

### **Types of HPLC Phases**

### Adsorption

- Normal Phase polar bed, non polar mobile phase (n-hexane, tetrahydrofuran)
- Reverse Phase non-polar bed w/ polar mobile phase (methanol, water, acetonitrile mixture)
- \* most common
- Ion Exchange
  - Stationary bed ionically charged surface, opposite to sample ions
  - Use with ionic or ionizable samples
  - Stronger charge = longer elution time
  - Mobile Phase aqueous buffer
- Size Exclusion
  - Column material precise pore sizes
  - Large molecules first, then small

### **Mobile Phase / Eluent**

- Purity

- Low viscosity
- Detector compatibility Chemical inertness
- Solubility of sample Price
  - o All solvents "HPLC grade"
    - Filtered using 0.2 µm filter
    - Extends pump life
    - Protects column from clogs
  - Solvent Degassing / Purging
    - Displacement w/ less soluble gas
    - Vacuum application
    - Heat solvent

# HPLC Columns (stationary phase)

- Stainless steel
- Common sizes:
  - 10,12.5, 15, 25 cm long
  - 4.6 mm i.d.
- Length for optimum separation dictated by theoretical plates needed for good resolution
  - Filled with stationary phase material (typically particles of ~5 µm)

# HPLC vs. UPLC (ultra performance LC)

н

Aripiprazole <sub>ci.</sub>

Dopamine agonist, used as a second generation antipsychotic drug

| Validation experiment           | HPLC method UPLC method            |                                    |  |

### What is LC/MS/MS ?

It is Liquid chromatography coupled with Mass Spectrometer

The discussion is restricted to the available instrument by Waters, Milford, MA (Micromass Quattro micro API Mass Spectrophotometer)

### Power of LC/MS/MS

- MS provides exceptionally clean product (fragment) ion chromatograms for quantification
- The signal-to-noise (S/N) ratio is optimized
- Useful for the rapid screening of complex samples where analytes of interest are known
- Compound identity confirmation can be achieved with MS/MS using the product ion scan mode
  - By detecting a specific product ion (precursor ion mode) or charged fragments resulting from a neutral loss (neutral loss mode), you can classify a compound of interest

# General Principle of Operation of LC/MS/MS

### The Analytical Chain of LC/MS

#### **Sample Treatment**

#### **Separations**

**Ionization/Interfaces** 

**Mass Analysis** 

**Data/Interpretation** 

## **Step 3** Interface and ionization

### The Analytical Chain of LC/MS

# **Interface and Ionization**

All interface/ionization combination must convert dissolved analyte eluting from a separation system into gas-phase ions at reduced pressure.

|                  | <b>LC</b> Conversion Process   | MS          |
|------------------|--------------------------------|-------------|
| State-of-matter: | Liquid-phase Evaporation       | Gas Phase   |
| Pressure:        | Atmospheric Pressure Reduction | High Vacuum |
| Charge State:    | Neutral(Ionic) Ionization      | Ionic       |

### **Ionization Source**

Broad range of atmospheric pressure ionization (API) sources

- Electrospray (ESI) probe the most widely used API technique for sensitive, general analysis of polar & ionic comp.
- Atmospheric Pressure Chemical Ionization (APCI) probe ionization capabilities for less polar & neutral chemical species
- IonSABRE<sup>TM</sup> APCI excellent sensitivity for less polar & nonpolar analytes, especially at higher liquid flow rates
- ESCi<sup>M</sup> Multi-Mode Ionization combines ESI and APCI in the same analysis
- APPI<sup>M</sup>/APCI Dual Ionization provides APCI in simultaneous operation with photoionization (PI)
- MUX-technology<sup>™</sup> provides the ability to multiplex four sample streams into a single Waters Micromass mass spectrometer

### **Ionization-Continuum Diagram**

# **Electrospray (ES)**

□In an electrospray interface, the column effluent of LC is nebulized into an atmosphere-pressure ion source.

- ES is composed of a hollow needle with a high electrical potential through which the effluent flows (1-10uL/min).
- The high field at the tip of the needle produces a cone shaped liquid meniscus from which a spray of highly charged droplets emerges.
- Subsequent evaporation of the droplets results in ion formation.

## **Ionization in Electrospray**

- Ionization of the solute in solution.
- Nebulize the solution and charge the droplets.
- Desolvation of the droplets by evaporation.
  - Desorption of the solution ions to gas phase ions.

From: Harris, 1999

## **ESI** types

- Positive
  - Use volatile proton donor (e.g., 0.1% formic acid)
- Negative
  - Use volatile proton acceptor (e.g., 0.3% NH<sub>4</sub>OH)

### **Matrix Effects**

Suppression

Enhancement

Mostly occur in ESI

# <u>Step 4</u> Mass analysis: Mass spectrometer

### The Analytical Chain of LC/MS

## Types of MS

- 4 Types commonly used in environmental analysis
  - Magnetic Sector MS
  - Quadrupole MS
  - Ion-trap MS
  - Time of Flight MS

### Others

 Fourier Transform Ion Cyclotron Resonance MS (FT-ICR)

# **MS Quadrupole**

#### Most common mass analyzer

- in use since the 1950s
- Quadrupole MS are smaller, cheaper and more rugged than magnetic sectors
- Low scan times (<100 ms) ideal for GC or LC inlets</p>
  - Called mass filters rather than mass analyzers
    - ions of only a single mass to charge (m/q) ratio pass through the apparatus
    - separate ions based on oscillations in an electric field (the quadrupole field) using AC and DC currents

# Schematic of Quadrupole

#### Quadrupole

Schematic of a quadrupole MS system.

#### Quadrupole

This analyzer consists of four rods.

Rods operate in pairs (X or Y) and each carries a voltage.

Only ions of the proper M/Z value can successfully traverse the entire filter (Z axis)

#### Hardy, U of Akron

### **Operation of Quadrupole Mass Filter**

- voltages applied to electrodes affect trajectory of ions with the m/q ratio of interest as they travel down the center of the four rods
- these ions pass through the electrode system
- ions with other m/z ratios are thrown out of their original path
- these ions are filtered out or lost to the walls of the quadrupole, and then ejected as waste by a vacuum system
- in this manner the ions of interest are separated

### MS/MS

### **Time-of-Flight Mass Spectrometry**

- Ionization: positive ions are produced periodically by bombardment of the sample with brief pulses of electrons, secondary ions, or in cases lasergenerated photons.
- Acceleration: The ions are then accelerated by an electric field pulse of 10<sup>3</sup> to 10<sup>4</sup> V (the "pusher") that has the same frequency as, but lags behind, the ionization pulse
  - Drift: The accelerated particles then pass into a field-free drift tube. The drift tube's length can range from 0.5 3.0 meters

# **Time-of-flight MS**

### Bioassays

## **Biological Activity Tests**

- Estrogenic and antiestrogenic activity will be assessed by measuring changes in gene expression in the Japanese medaka fish.
  - expose fish to 1-L water sample for 96 hours
  - sacrifice the fish; livers removed
    - other tissues, e.g. gonads and brain also will be removed, stored in RNAlater® and archived for potential future studies or examination of expression of other genes
  - measure vitellogen in mRNA in the liver using real time reverse transciptase PCR (Roche Light Cycler).
    - Detection limit is typically 10 femtomolar
  - Vitellogenin, the precursor egg yolk protein
    - normally produced only in female fish but
    - male fish exposed to xenoestrogens will also produce it.

### The Yeast Estrogen Screen (YES) is an *invitro* test to measure estrogenic activity

Routledge, E.J. and Sumpter, J.P. (1996) Environ. Toxicol. Chem. 15, 249 248

### Activity Assay Outputs

### Antibiotic Challenge (ABC)

Relies upon growth of *Bacillus stearothermophilus* spores Test takes 2.5 hours

Negative

Erik RosenfeletOSitive

### Immunoassays

Slide courtesy of Meyer et al., USGS

### Immunoassay Types

### Enzyme-Linked Immunosorbent Assays

### Coated

- Tubes
- 96-well plate
- Magnetic Particle
- ➢Radioimmunoassay
- ➤ H<sub>3</sub>, C<sub>14</sub>

#### General Immunoassay Concept

Step 1. The unknown analyte in the sample competes with a known amount of hapten-enzyme conjugate.

Step 2. Excess reagents (unbound) are removed by washing the solid-phase with a buffer or distilled water.

### The End

### To next lecture
