ITS LIT

Block Diagram

Promised CDR Deliverables

PJ

- PCB design & display policy complete

Tommy

- Server and app transmit/receive data and queuing algorithm has been started

Emma

- Raspberry Pi computer controls a 2-dimensional display for CDR and renders at least one image type from server

Mike

- Multiple views for categories/settings complete and help with app/server interaction

Varun

- App is able to send, receive requests and interact with server

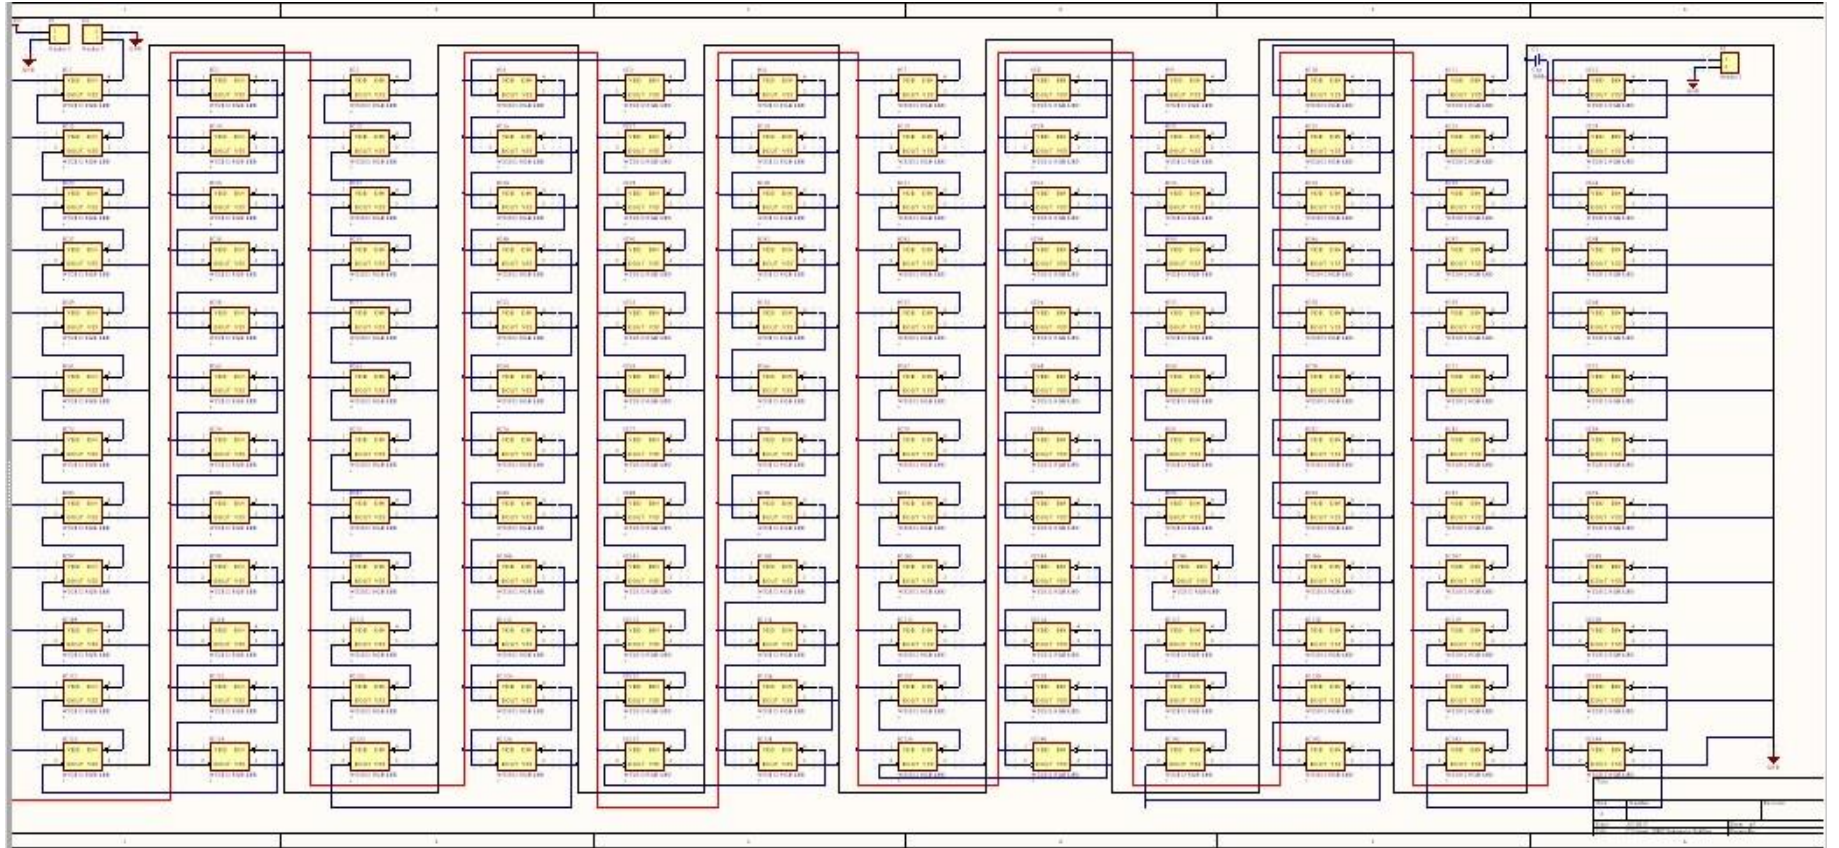

Neopixel Display PCB

x: -1000.000 dx: 13500.000 mil
y: 7500.000 dy: -1000.000 mil
Top Layer
Snap: 500mil Hotspot Snap: 8mil

PL
B3

PCB

PCB

- 9 total PCB's
- Each is 1' x 1'
- Pixel Pitch of 1"
- Each Board has 144 LED's
- Each Board has a Data line, Power, and Ground
- PCB designed using Altium

Display Policy

- Working on a proposal to send to the University Public Art Committee
- They will determine if we can deploy the display

Display Control

Deliverable: Raspberry Pi computer controls a 2-dimensional display for CDR and renders at least one image type from server

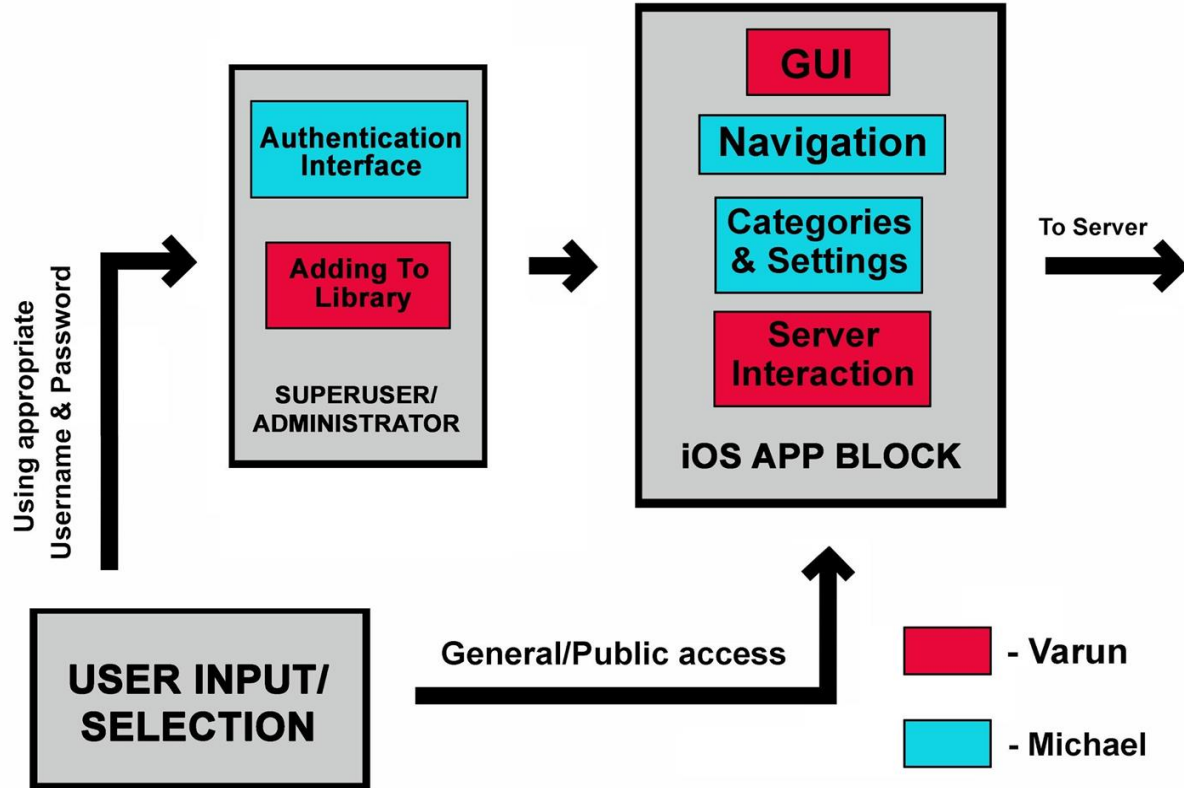

Delivered: Pi renders jpeg images on 84 RGB LED prototype display

- Upgraded from Arduino Uno to Raspberry Pi 2
- jpg format files resized to fit display with good results
- Hardware calibration Gamma correction for brightness/duty cycle done via 255 value lookup table
- Neopixel 2D prototype used
- Logic level shift between Pi and pixel data signal

To Do:

- Drive upgraded 1296 LED display

iOS App

iOS App

Tasks Completed:

- Intermediate GUI and Navigation completed
- Sample library with presets
- App is able to take in user input (image selection) and submit a request to the apache server
- App sends data to server through 'post' request using the Alamofire library
- App runs on iOS 10.2 simulator for iPhone 6/6+/7/7+

iOS App

The screenshot displays the Xcode IDE with the following components:

- File Browser (Left):** Shows the project structure for 'ITS LIT - LED Display', including folders for 'Tests', 'Products', and 'Assets.xcassets'. The 'ITS LIT - LED Display' folder is expanded, showing files like 'AppDelegate.swift', 'ViewController.swift', and 'SecondViewController.swift'.
- Storyboard Editor (Center):** Shows a storyboard with three scenes: 'View Controller Scene', 'Second View Controller Scene', and 'Navigation Controller Scene'. The 'View Controller Scene' is selected, showing a view with a colorful background and the text 'ITS LIT' and 'Enter'. The 'Second View Controller Scene' shows a view with a rainbow flag, a UMass logo, and buttons for 'LGBT Pride' and 'UMass Amherst'.
- Identity Inspector (Right):** Shows the 'Identity and Type' section for the selected storyboard, with 'Main.storyboard' selected. It also shows the 'Interface Builder Document' section, which is configured for 'Latest Xcode (8.0)' and 'Deployment Target (10.2)'. The 'Localization' section shows 'Base' selected, and the 'Target Membership' section shows 'View Controller' selected.

The status bar at the bottom indicates the app is running on an iPhone 6, and the view is set to 'View as: iPhone 7 (wC hR)' at 34% zoom.

iOS App

Tasks Remaining:

- Finish up advanced GUI and Navigation
- Populate entire library with categories and presets
- Super-user authentication, privileges and settings
- App geo-fencing (using Location services & Maps)

Power Supply

- Each LED draws 60 mA when white (max)
- Each board ($12 \times 12 = 144$ LED's) draws 8.64 A when all white (max)
- Total power consumption for the entire 9 boards is 388.8 W when all white (max)

Server

- Apache webserver hosted on a Raspberry Pi
 - Requests from app are received via an HTTP post request through a PHP script
 - Requests are then stored on an SQL database
- Queuing algorithm written in python and has access to database to retrieve requests
 - FIFO queue
 - Manages how long each image stays up on display (set time)

Integration Achieved and Required

Achieved design integration:

- App and server integration
- Pi and display hardware integration

Required still:

- Pi and server integration
- Power supply and hardware integration

Demo

Proposed FPR Deliverables

PJ

- Display complete, incl. integration with power supply and Pi

Tommy

- Display is able to receive requests from queue and server

Emma

- Pi able to render images on full display incl. some hardware interface

Mike

- App geofence, super-user authentication process & display chassis complete

Varun

- Advanced app GUI, super-user privileges & power supply complete

Questions?
