This course is designed to be an introductory course to engineering heat transfer. Concepts including control volume analysis, conservation laws of mass, momentum and energy, conduction, laminar and turbulent convection, phase change and radiation will be developed and applied. The problems and examples will include theory and applications drawn from a wide range of engineering design and manufacturing problems.

Instructor
Professor Jonathan P. Rothstein
Gunness Labs Rm.16
577-0110

Course Text

Grading
The course grade will be based on two midterm exams and a final exam with the following weight:
Homework 15%
Hour Exams (2) 50%
Final Exam 35%

Homework
A set of homework problems will be assigned roughly once a week during lectures. You should work through these problems carefully as they are essential for your learning of the material. The problems will be typically collected and graded on Tuesdays. Over the course of the semester you will receive several computational heat transfer homework assignments which will require the use of a software package such as EES, Matlab, C++, visual basic or even Excel.
