Read this Operating Manual through carefully before using the BÜCHI Rotavapor R-220. Always keep these Instructions readily available in the immediate vicinity of the unit so that they make be consulted at any time.

Chapter 2 contains important safety rules which must be observed to ensure the safe operation of the rotary evaporator.

We reserve the right to make technical changes without prior notification. No portion of this Operating Manual may be reproduced, processed using electronic or optical systems, duplicated, or distributed in any form without the prior written approval of BÜCHI Labortechnik AG. All rights reserved. © BÜCHI Labortechnik AG, 1999-2001

Table 2: Standard Accessories
2 Safety

This unit has been built in accordance with the latest state of the art and with recognized rules of safety. Nevertheless there are certain risks and dangers entailed with this unit:

- whenever the unit is operated by individuals who lack sufficient training;
- whenever the unit is used for some purpose other than its authorized use.

2.1 Symbols

<table>

</tr>
</tbody>
</table>

2.2 Responsibilities of the Operator

This unit may only be used by technical staff and by individuals who, based on their training or their professional experience, have a good understanding of the dangers that can arise from its operation.

Staff who do not have this training and individuals who are currently in training must be given careful instructions. This Operating Manual should be used as the basis for such training.

2.3 Authorized Use

The rotary evaporator has been designed for use in technical laboratories and in production. It is authorized for use in applications that work with the evaporation and condensation of solvents.

It is used for:

- Evaporation of solvents and suspensions
- Drying of powders and granulates
- Re-crystallization
- Reactions under reflux
- Synthesis and Cleaning of refined chemicals
- Recycling and concentration of solvents

The authorized use of the Rotavapor also includes its care, upkeep, and careful handling in accordance with the provisions in this Operating Manual.
2.4 Unauthorized Use

Any use other than those indicated above, and any use that is not in conformity with the Technical Data is considered to be misuse. The operator himself bears sole responsibility for all damage or injuries arising from any such use.

The following applications in particular are strictly forbidden:
- The production and processing of materials that can cause spontaneous reactions, e.g., explosives;
- Working without the evaporation flask being immersed in the water bath (risk of breakage);
- The drying of hard, brittle materials (e.g., stones, soil samples) that might cause damage to the receiving flask;
- Sudden shock-cooling of the evaporating flask.

The Rotavapor R-220 is not intended for work done under overpressures.

2.5 Basic Dangers

Basic dangers arise when working with the following:
- The hot water or oil bath (risk of being scalded);
- Contaminated solvents that produce residues from distillation which could cause spontaneous reactions (e.g., metal hydrides);
- Solvents that can produce peroxides (risk of explosions);
- Mixtures with unknown compositions or contamination;
- Damaged glassware;
- Electrostatic charges while working, e.g., during the transfer of combustible solutions and while drying powders;
- Temperatures of coolants that lie below the freezing point of the distillate (A clogging of the distillate cooler due to freezing out can result in too great an overpressure).

2.6 Safety Precautions

All regional and local laws and regulations must be observed.

The Rotavapor has been grounded internally to dissipate any electrostatic charges on it.
It is always mandatory to wear personal protective gear such as protective eyewear and protective clothing.

The machine must never be rotated without the snap flange coupling and evaporation flask being closed.

No distillation may be started unless the evaporating flask is immersed in the bath. There is always the risk that the neck of the flask might break off due to the great weight involved. There is a risk of becoming scalded while changing evaporating flasks. Wearing gloves prevents this.

Check the glass components regularly for possible damage, spreading impact marks, or cracks.

Never interrupt the grounding conductor (protective conductor). Otherwise there will be the risk of an electrical shock!

The operator bears responsibility for providing proper instruction of his operating staff. To aid him in doing this, translations of this Operating Manual are also available in several other languages. As an integral component of the rotary evaporator, this Operating Manual must be readily available at all times to the operating staff at the location where they are using the unit.

The operator must inform the manufacturer immediately of any and all events relevant to safety that occur in his use of this equipment.

2.7 Modifications

No modifications are permissible without consulting with and obtaining the written approval of the manufacturer.

No glass assemblies other than those recommended by the manufacturer may be used, nor may any glass components be put together arbitrarily.

Only those components of the rotary evaporator intended for fulfillment of its function may be installed in or removed from the unit. This may be done either by hand, or with the use of the tool supplied along with the unit. The removal of safety devices or covers using some commercially available tool is — other than for authorized commissioning personnel — strictly forbidden. Contact with parts that are electrically live may result in fatal injury!
3 Function

A vacuum rotary evaporator is used for quick single-stage distillations that treat the product gently. The process is based on the evaporation and condensation of solvents in a rotating evaporating flask.

It is possible to work under a vacuum to ensure gentler treatment of the product and increase productive output.

Distillation may be done either under a vacuum or at atmospheric pressure.

A secure closeness is guaranteed in the low pressure range.

3.1 Principle of Operation

1. **Evaporation Zone**
   The solvent in the evaporating flask is heated by the heating bath. The rotation of the evaporating flask ensures an intensive exchange of heat and mass within the contents of the flask, forming a thin film of solvent on the inner surface of the flask. This combination of turbulence and film prevents local overheating and ensures high distillation speed.

2. **Rotary Drive**
   The drive unit ensures the uniform rotation of the evaporating flask.

3. **Cooling Zone**
   The solvent vapor flows into the cooler at a high speed. This is where the energy in the solvent vapor is transferred to the cooling medium (e.g., water). The solvent condenses.

4. **Receiving Flask**
   The receiving flask is used to collect the condensate.

5. **Vacuum Cover**
   The system pressure is reduced so as to lower the boiling point of the solvent. The reduction in thermal loading that results ensures gentle treatment of the product and offers energetic advantages.

The pressure (vacuum) of distillation, the temperature of the heating bath, the rotational speed, and the size of the evaporating flask all affect the evaporation output. Refer to Chapter 5.3 for how to select the optimum conditions of distillation.
4 Putting into Operation

The danger zone around the Rotavapor R-220 can extend outward by up to 10 m. When working inside this danger zone, there is a risk of damaging the glass parts, which could cause them to implode.

The electrical connection must be installed and checked by an authorized person.

4.1 Installation Location

Always set the unit up on a clean, stable, and flat surface. Never at a location where there is a great deal of personal traffic (breaking or broken glass)!

The dimensions of the rotary evaporator are:

<table>

4.2 Unpacking

Take care not to break the glass when opening cartons that contain glassware.

Look for any damage after unpacking. It is important that any damage in transit be identified right when unpacking. If necessary, make an immediate assessment of the situation (Notify the post office, the railroad, or the shipping company involved). Save the original packing for possible transport at a later date.
4.3 Setting up the Support Rod

- Place the support rod ② into the holder provided for it and lower it into the foot hole at the back. Fix it tight using the locking screw ①.
- Put the positioning ring ③ on over the rod, 150 mm below the upper edge.
- Lay the pivoting clamp ④ on top of the positioning ring.
- Attach the pivoting clamp for the receiving flask 200 mm above the bottom edge of the rod.

When installing an interchangeable receiver:

- Place the short support rod into the holder at the front and lower it into the foot hole. Screw it tight using the locking screw.
- Attach the pivoting clamp approx. 200 mm above the lower edge of the rod.

Fig. 3: Support rod
4.4 Attachment of the EasyClamp

- Carefully lay the EasyClamp around the glass and fold the top and bottom segments together, closing them at their open connection point.
- Insert the bolt that does not have a spacer spring, and tighten the knurled nuts slightly.
- Tighten all knurled nuts uniformly by hand.

**Note:**
Always tighten the knurled nuts by hand and not to the block (with the spring pressed together completely). Otherwise the prestressing will be lost.
There must always be a gap of about 2 mm between the knurled nut and the support surface.

4.5 Removal of the EasyClamp

On all EasyClamp connections, **only the bolt without a spacer spring** has to be removed in order to open the connection.

- Release the knurled nuts on all (2 or 3) bolts until the springs have been relieved. Do not, however, screw the nut all the way off.
- On the bolt that does not have a spacer spring, release the knurled nut far enough (without removing it completely) so that the bolt can be tilted out and removed as a unit.
- At the connection point, which is now open, spread the top and bottom segments apart and carefully remove the EasyClamp.
### 4.6 Installation of the Reflux Glass Assembly

All glassware used must be intact, with no signs of cracks, spreading impact marks, or other damage. Inspect the glassware visually before installing it.

- Fix the reflux distribution head ① in position on the gear head using a DN70 EasyClamp connection.
- Introduce the cooler ②, together with the cooler holder ③, into the pivoting clamp ④ and connect it to the distribution head (DN45 EasyClamp connection).
- Align the cooler ② in a vertical position and fix it in place with the pivoting clamp ④.
- Screw the cooling water hose nipples ⑤ onto the cooler ②.
- Insert the shut-off tap ⑥ into the distribution head ① and tighten it firmly.
- Introduce the stop cock ⑦ into the distribution head with the PTFE hose attached to it, and secure it with a standard joint clamp ⑧.
- Attach the condensate cooler ⑨ to the distributor head with a DN25 EasyClamp connection and fix it in position.
- Screw the temperature sensor ⑩ into the distribution head ①.
- Check all EasyClamp connections and tighten them evenly and in parallel.

→ The installation of the receiving fixture is described on Page 13.
4.7 Installation of the Descending Glass Assembly

All glassware used must be intact, with no signs of cracks, spreading impact marks, or other damage. Inspect the glassware visually before installing it.

- Fix the descending distributor head ① in position on the gear head using a DN70 EasyClamp connection.
- Put the expansion vessel ② onto the distribution head and fix it in position with a DN45 EasyClamp connection.
- Introduce the cooler ③, together with the cooler holder ④, into the pivoting clamp ⑤ and connect it to the distribution head (DN45 EasyClamp connection).
- Connect to the cooler and the expansion vessel using the U-tube ⑥ and fix in position with two DN45 EasyClamp connections.
- Align the cooler ③ and the expansion vessel ② in their vertical positions and fix them in place with a pivoting clamp ⑤.
- Screw the cooling water hose nipples ⑦ onto the cooler ③.
- Insert the stop cock ⑧, with the PTFE hose mounted on it, into the distribution head, and secure it with a standard joint clamp ⑨.
- Fasten the vacuum connector ⑩ to the Y-connection ⑪ with a DN45 EasyClamp connection and fix the unit in place on the lower end of the cooler with a DN45 EasyClamp.
- Screw the temperature sensor ⑫ into the support connection in the U-tube ⑥.
- Check all EasyClamp connections and tighten them evenly and in parallel.

→ The installation of the receiving fixture is described on Page 13.
4.8 Installation of the Descending Glass Assembly with a 2nd Cooler

All glassware used must be intact, with no signs of cracks, spreading impact marks, or other damage. Inspect the glassware visually before installing it.

- Fix the descending distributor head ① in position on the gear head using a DN70 EasyClamp connection.
- Place the expansion vessel ② on the distribution head and fix it in position with a DN45 EasyClamp connection.
- Introduce the cooler ③, together with the cooler holder ④, into the pivoting clamp ⑤.
- Connect the cooler and the expansion vessel with the U-tube ⑥ and fix them in position with two DN45 EasyClamp connections.
- Insert the second cooler ⑦, together with the cooler holder ⑧, into the pivoting clamp ⑨.
- Join the two coolers with the Y-connection ⑩ and fix them in position with two DN45 EasyClamp connections.
- Align the coolers ③ and ⑦ and the expansion vessel ② in their vertical positions and fix them in place with pivoting clamps ⑤ and ⑨.
- Screw the cooling water hose nipples ⑪ onto coolers ③ and ⑦.
- Insert the stop cock ⑫, with the PTFE hose mounted on it, into the distribution head, and secure it with a standard joint clamp ⑬.
- Screw the temperature sensor ⑭ into the support connection in the U-tube.
- Check all EasyClamp connections and tighten them evenly and in parallel.

→ The installation of the receiving fixture is described on Page 13.
4.9 Installation of the Receiving Fixture

All glassware used must be intact, with no signs of cracks, spreading impact marks, or other damage. Inspect the glassware visually before installing it.

Single Receiver

- Fasten the support ring ① to the support rod with a pivoting clamp ②.
- Screw the outlet valves ③ on the receiving flask ④ on tight using a DN25 EasyClamp connection.
- Place the receiving flask on the support ring ①.

With a reflux glass assembly:
- Bring the support up and fix the flask in position on the distillate cooler using a DN25 EasyClamp connection.

With a descending glass assembly:
- Attach the branching piece ⑤ to the opening at the bottom of the Y-connection with a DN45 EasyClamp connection.
- Insert the shut-off tap ⑥ into the branching piece ⑤ and tighten it firmly.
- Bring the support up and fix the receiving flask ④ in position on the branching piece ⑤ using a DN25 EasyClamp connection.

Dual Receiver

- Fasten the support rings ① to the support rods at the front and back using pivoting clamps ②.
- Screw the outlet valves ③ firmly onto the receiving flask ④ using DN25 EasyClamp connections.
- Place the receiving flasks ④ on the support rings ①.
- Screw the two shut-off taps ⑤ into the branching pieces ⑥ and ⑦ and tighten them.
- Connect the branching pieces with a DN25 EasyClamp connection. Place them on the receiving flasks ④, and fasten them with DN25 EasyClamp connections.

With a reflux glass assembly:
- Bring the receiving flask up, and fasten the branching piece ⑦ to the condensate cooler using a DN25 EasyClamp connection.

With a descending glass assembly:
- Bring the receiving flask up, and fasten the branching piece ⑦ to the Y-connection using a DN25 EasyClamp connection.
4.10 Attaching and Removing Flasks

**Bring up the flask**

- With the snap flange coupling open, lay the flask in position.
- Close the first segment of the snap flange coupling (The hook must latch in).
- Close the second segment of the snap flange coupling.
- Insert the closure hook and press down the closure lever. A clear resistance must be felt when this is done. If not, readjust the tension on the closure.

Adjusting the tension on the closure:

Open the closure hook up, and turn it.

Turning clockwise increases pressure
Turning counterclockwise reduces pressure

If the flange of the evaporating flask is outside of a certain tolerance, the adjustment with the hook is not possible. This evaporating flask must not be used!
Removing flasks

- Place your hand under the flask to hold it from below.
- Open the closure lever 1.
- Use your thumb to release the closure hook 2.
- Flip up the first segment of the snap flange coupling.

- With your hand under the flask, lift it lightly slightly from below and relieve pressure on it.
- Press the hook 3 in.
- Open the second segment of the snap flange coupling.
- Lift the flask out at the top and remove it.
4.11 Hose Couplings

In general, observe the following items for all glass assemblies.

The cooling water inlet is always at the lower condenser connection.
When there are two condensers (D2 und DB2), the two condensers can be connected serially, the additional condenser being cooled first.

The following is the key for all of the hose diagrams on these two pages.

① Cooling water inlet for first condenser
② Cooling water outlet for first condenser
③ Cooling water inlet for second condenser
④ Cooling water outlet for second condenser
⑤ Vacuum connection
⑥ Vacuum controller
⑦ T-piece (026117)
The following is the key for all of the hose diagrams on these two pages.

1. Cooling water inlet for first condenser
2. Cooling water outlet for first condenser
3. Cooling water inlet for second condenser
4. Cooling water outlet for second condenser
5. Vacuum connection
6. Vacuum controller
7. T-piece (026117)

Fig. 18: Hose Couplings 2
4.12 Operating the Shut-off tap

The shut-off tap is of a special design. It does not have a continuous thread on its inside for tightening it, but rather a sliding plane with two fixed latching positions. The closing pressure when it is in a closed position is provided by a prestressed spring.

- Insert the shut-off tap on the distribution head and turn the white lower section of the grip \( \text{①} \) clockwise until the shut-off tap is tightly seated.
- To open:
  - Turn the gray upper section of the grip \( \text{②} \) clockwise until the shut-off tap latches into the 1st position.
  - If the opening is not large enough, continue turning until the shut-off tap reaches the 2nd position.

4.13 Bath Replenishment (Optional)

- Bath replenishment inlet
  - Hose nipple, Diam. 14 mm
- Bath replenishment outlet
  - Hose nipple, Diam. 14 mm

Opening the needle valve \( \text{③} \) slightly by one-quarter turn produces a continuous supply flow.

Introduce the Open/ Shut valve supplied with the unit into the bath replenishment inlet \( \text{①} \) and connect it to “CW Valve” on the back wall of the unit. This interrupts the replenishment of the bath when rotation stops.

The installation of the water valve is described in chapter 8, Replacement Parts, Water Valve.

If oil is used as heating medium, the bath replenishment has to be emptied and disconnected from the water inlet. Otherwise, there is a risk of water pouring into the hot oil bath.

**Operating Instructions!**

When rotation stops, the cooling water and bath replenishment water switch OFF after short delay. As soon as rotation starts, the valve reopens and the water flows once again.
4.14 Reset of the over-temperature protection

If the heater heats up over 205°C (e.g. if no heating medium is in the bath), it is cut off by a mechanical overtemperature protection. The overtemperature protection is reset by pushing the button under the heating block.

4.15 Heating Medium

Never operate the heating bath when there is no heating medium in it!

Suitable heating media include:
- Water (some Borax should be added when using deionized water)
- Heat transfer oils suitable for use at temperatures up to 160°C (e.g., Ucon HTF 14, Fluka AG).
- Water-soluble polyethylene glycol (e.g., Polyethylene glycol 600, Fluka AG).

After the oil bath has been standing opened for a prolonged period, condensation water can collect on the bottom. When the bath is used again, it must be heated above 100°C with rotating flask in order to drive the water out.

4.16 Checking Installation

After installation has been completed and before doing the first distillation, check to make sure the installation has been carried out correctly:
- Inspect the glass visually for possible damage.
- Check that all connections (steam, water, vacuum) have been fixed properly in position.
- Check the tightness of the vacuum.
5 Operation

Make certain that the unit has been commissioned properly as described in Chapter 4.

5.1 Arrangement of the Operator Control and Display Elements

1. Main breaker switch
2. Lift for the bath
3. Rotation ON/OFF
4. Rotating speed adjustment
5. Rotating speed display
6. Heater ON/OFF
7. Input: Set-point temperature for bath
8. Temperature UP/DOWN
9. Display for bath temperature
10. Display for vapour temperature
11. Aeration

The bath is lowered automatically when the unit is switched off or in case of a power failure to ensure that the evaporating flask will in all cases remain outside the source of heat (optional).

5.2 Adjusting the Maximum Set-Point Temperature and Automatic Lowering of the Bath in Case of a Power Interruption

Setting the Maximum Set-Point Temperature

- Press the button “SET TEMP” (7), simultaneously switching on the main breaker switch (1). This activates the input for setting the maximum set-point temperature.
- The value can be set at any level desired by pressing the “DOWN” and “UP” buttons (8).
- The input is stored and the unit switched into the operating mode only after the "AERATE" button (11) is then pressed.
Adjusting the Optional Automatic Lowering of the Bath in Case of a Power Interruption

- Press the button “LIFT down” ②, simultaneously switching on the main breaker switch ①.
This results in the display “ON” or “OFF”.
On = The lift lowering has been switched ON
Off = The lift lowering has not been switched ON.
- To switch back and forth between ON and OFF, press repeatedly on the button “LIFT down” ②.
- The input is stored and the unit switched into the operating mode only after the “AERATE” button ③ is then pressed repeatedly.

5.3 Tips and Tricks

Selection of the Distillation Temperature

In order to attain optimum distillation conditions, the energy supplied to the distillation from the bath must be dissipated again across the cooler. In order to ensure this, it is best to work according to the following rule of thumb:

<table>
<thead>
<tr>
<th>Cooling water</th>
<th>∆T2 Boiling temperature</th>
<th>∆T1 Bath</th>
</tr>
</thead>
<tbody>
<tr>
<td>max. 20 °C</td>
<td>40 °C</td>
<td>60 °C</td>
</tr>
</tbody>
</table>

How do you attain these conditions?

- Set the bath temperature at 60 °C.
- Adjust the cooling water. Its temperature should not be higher than 20 °C.
- Allow the cooling water to flow through the cooler at a rate of about 120–150 liters/hr.
- Select the working vacuum so that the boiling point of the solvent is at 40 °C.
- Obtain the corresponding value for the vacuum from the Table of solvents.

Advantages of a Bath Temperature of 60 °C

- Evaporating flasks can be changed without any danger of scalding.
- The rate of water evaporation out of the heating bath is not yet very high.
- The energy in the heating bath is being utilized very efficiently.

The solvent should condense out in approx. 2/3 to 3/4 of the lengths of the cooling coils present.

Table 3: Table of Solvents (CRC Handbook, 65th Ed)
6 Maintenance

Please note all rules aimed at keeping the rotary evaporator in a functional condition. These also include periodic cleaning and inspection for any damage that might have occurred.

Make certain that supply of power to the unit has been interrupted before doing any maintenance work on the unit. Always support the bath from below, on the underside of the bath whenever doing any repair work.

6.1 Taking Apart the Snap Flange Coupling

- Close the two segments of the snap flange coupling.
- Turn the snap flange coupling by 180°, until the closure faces down.
- Have Tool No. 20075 ready at hand.
- Reopen the closure.
- Lift the 1st segment of the snap flange coupling to open it.
- Lift the 2nd segment of the snap flange coupling to open it.
- With three fingers at the tip, reach under the middle segment and raise it up.
- Insert Tool No. 20075 in at the side, between the lugs on the positional lock. Turn lightly until the pin becomes unlatched. Take the snap flange coupling assembly off.
- Clean the snap flange coupling.

Fig. 24: Snap flange coupling, closed
6.2 Assembling the Snap Flange Coupling

- Insert the snap flange coupling from above, until the pins in the lock latch into the hole on the lug.
- Close the two segments of the snap flange coupling.
- Turn the snap flange coupling again by 180°, until the closure lies at the top.
- Lift the two segments of the snap flange coupling to open them.
- Lay the neck of the glass flask into the middle segment and raise the flask slightly.
- Pull the segment on the left back slightly and close it until the hook latches in place.
- Close the segment on the right.
- Insert the closure hook and close the snap flange coupling with the closure lever. A clear resistance must be felt when doing this. Otherwise no seal can be fully guaranteed.

6.3 Removing the Evaporating Flask Seal

- Seal the holder for the seal by 180°, until the opening faces up.
- Take hold of the seal with both hands, from above and from the front, and pull it out slowly.
- Tilt the seal slightly and carefully pull it all the way out. Be careful not to damage the glass centering bulge when doing so.
- Remove the vapor duct.
6.4 Inserting the Evaporating Flask Seal

- Insert the vapor duct.
- Insert the seal. Using gentle pressure, shove it across the lock preventing it from twisting out of position, and then shove it all the way in. Press it with both thumbs until it latches in position.
- The knob ① in the gearhead must come to rest in the notch ② in the vapour duct.

6.5 Replacement of the Seals for the Distribution Head

- Open the DN70 EasyClamp by releasing the knurled nuts on all 3 bolts, but do not screw the nuts completely off.
- Tilt the top bolt out toward the back.
- Open the upper and lower EasyClamp segments and carefully lift the distribution head off the glass assembly.
- Take out the seal ① laid in at the front and replace it.
6.6 Replacement of the Vacuum Seal

- Remove the DN70 EasyClamp completely and take off the distribution head.
- Pull the cylindrical seal holder out and turn it over.
- Insert Tool No. 20075 into the metal guide on the seal and pull the seal out.
- Put in the new seal with the dark scraper ring facing the inside and the metal guide ring facing outward.
- Insert the cylinder with the seal at the back lying on the inside.
- Insert the seal at the front.
- Provisionally install the EasyClamp using 2 bolts.
- Set the distribution head of the glass assembly on top of the seal.
- Close the segments of the EasyClamp. Flip the top bolt up and in, and hand-tighten all 3 knurled nuts.

**Tip:**
When the glass assembly “R” is in place, the vacuum seal can be taken out and/or cleaned without the glass assembly having to be removed.

- Remove the complete DN70 EasyClamp assembly from the distribution head.
- Using a socket wrench, release the fastening for the support rod.
- Carefully turn the glass assembly out around the support rod as an axis.
- Remove the seal.

6.7 Cleaning

Use commercially available cleaning agents to clean the glassware.

Merely wipe the housing off with a damp cloth (without using any organic solvents).

Use a commercially available de-liming agent to dissolve residues of lime in the bath and flush the bath out well.
6.8 Vacuum Seal

The seal should be cleaned whenever necessary, but at least once every six months.

During the intake phase, which lasts approx. 10 hours, the seal will show signs of greater material loss due to wear. This is normal for a PTFE seal.

Cleaning

Before the packet of seals can be removed, the distribution head must be released and screwed off. The complete seal packet can then be taken out and cleaned.

Wipe off the sealing lip using a soft, dry cloth. Clean the running surface on the vapor duct well.

Regular cleaning of the seal will result in a longer service life for it.

6.9 Testing for Leaks

After the rotary evaporator has been completely assembled and before putting it into operation, i.e., while it is clean and dry, check for tightness of the vacuum. To do this, evacuate the unit to below 100 mbar and then close the vacuum line. The rate of pressure rise must not exceed 3 to 5 mbar per 15 minutes.

A greater pressure rise indicates a leak in the vacuum seal. In such a case, recheck all EasyClamp connections and all valves.

6.10 Customer Service

No intervention on or in the unit is permissible except when done by authorized Service personnel. These are individuals with a well-backed technical professional training and knowledge of the dangers that result from a failure to observe the safety precautions required. BÜCHI's Customer Service representatives have available to them a Service Manual specific to the unit in question. That manual is issued only to authorized Service personnel.

The addresses of BÜCHI's official Customer Service representatives are shown on the back cover of this Operation Manual. Please turn to these representatives should you have any malfunctions, technical questions, or problems in using the unit.

BÜCHI's Customer Service Dept. will be ready and happy to offer the following services:

- Spare parts service
- Repair service
- Maintenance service
- Technical consultation.
7 Taking out of Operation

Remove all hazardous materials and clean the unit thoroughly. This prevents any risk that individuals could suffer injuries due to contact with hazardous materials.

7.1 Storage

Always store the unit and spare parts for it in a clean and dry location.

7.2 Packing / Transport

The original packing has been specially designed for transporting the unit and the glass parts for it. Use only the original packing materials for any further transport.

7.3 Waste Disposal

Table 7 in the Appendix, Chapter 9, contains a list of the materials, including their material codes, used for the most important components of the unit. This list has been provided in order to enable environmentally correct disposal of the rotary evaporator. It ensures that the parts can be separated and sent for appropriate recycling. Please refer to the pertinent guidelines when disposing of electrical parts. In addition, observe all regional and local laws covering waste disposal.

Used batteries may be returned directly to your BÜCHI representative for disposal.
8 Spare Parts and Accessories

Only original BÜCHI accessories and spare parts ensure safe operation and a proper functioning of the unit. The use of spare parts and accessories other than those from BÜCHI is permissible only with prior approval of the manufacturer. The Spare Parts Catalog may be used for purposes of assembly and disassembly only in conjunction with the corresponding Chapters 4 and 7 in this Operation Manual. Disclosure and distribution to third parties, and manufacturing based on this manual are strictly forbidden.

Installation Instructions!

1) Put the lamella curtain ① on the support rod ②.
2) Turn the lamella curtain until position is parallel to the edge of the chassis.
3) Tighten the screw.

Foam detector

The foam detection consists of a special distribution piece for the descending glass configuration, the sensor, power supply and the aeration valve. The system will detect the rising foam and aerate the system for a split second.

| Foam detector | 40507 |
This special flask is particularly suited for drying powdery substances or a homogeneous mixture of solid products. The baffles attached on the circumference of the flask ensure an intensive circulation of the contents inside the flask.

### Installation Instructions!

1. Switch the unit OFF.
2. Remove the two bolts (1) and the plastic cover (2).
3. Put on the seal (3).
4. Plug in the plug (4).
5. Fasten the splash protection in place with the bolts (5).
6. Switch the unit ON.

### Operating Instructions!

Opening the splash protection switches the rotation OFF. When the splash protection is closed again, the flask starts to rotate once more when the rotation button is pressed.
**Component** | **Ordering No.**
---|---
**Water Valve**<br>Water valve cpl. | 41191
T-piece | 26835

**Installation Instructions!**

1) Switch the unit OFF.
2) Connect the water valve ① to the water cock.

With optional bath replenishment

3) Connect the water hose ② to the tee ③ and secure them with pivoting clamps ④.
4) Connect the end of the water hose ⑤ to the control valve for bath replenishment and secure it with pivoting clamps.

5) Connect the end of the hose ⑥ at “CW-in” on the R-220 and secure it with pivoting clamps.
6) Connect the valve plug ⑦ on the R-220 at the CW-Valve.
7) Switch the unit ON.

**Operating Instructions!**

When rotation stops, the cooling water and bath replenishment water switch OFF after short delay. As soon as rotation starts, the valve reopens and the water flows once again.
Component | Ordering No.

To let all possible error messages appear, the device must be shut off and on at least once per 24 h.
9.4 FCC requirements (for USA and Canada)

**English:**

This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to both Part 15 of the FCC Rules and the radio interference regulations of the Canadian Department of Communications. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment.

This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his own expense.

**Français:**

Cet appareil a été testé et s’est avéré conforme aux limites prévues pour les appareils numériques de classe A et à la partie 15 des réglementations FCC à la réglementation des radio-interférences du Canadian Department of communications. Ces limites sont destinées à fournir une protection décente contre les interférences néfastes lorsque l’appareil est utilisé dans un environnement commercial.

Cet appareil génère, utilise et peut radier une énergie à fréquence radioélectrique, il est en outre susceptible d’engendrer des interférences avec les communications radio, s’il n’est pas installé et utilisé conformément aux instructions du mode d’emploi. L’utilisation de cet appareil dans les zones résidentielles peut causer des interférences néfastes, auquel cas l’exploitant sera amené à prendre les dispositions utiles pour polir aux interférences à ses propres frais.
9.5 Declaration of Conformity

We

BÜCHI Labortechnik AG
P.O.Box, CH-9230 Flawil, Switzerland

declare on our own responsibility that the product:

BÜCHI Rotavapor R-220

to which this declaration refers conforms to the following standards:

EN 61010-1:1993 (~ IEC 1010-1, VDE 0411-1)
Safety Rules for Electrical Measurement, Control, and Laboratory Equipment: General Requirements

EN 61326-1:1997
Electrical Equipment for Measurement, Control and Laboratory Use. EMC Requirements

EN 61000-3-2: 1995/1996
Limits for harmonic current emissions
EN 61000-3-3: 1995
Limitation of voltage fluctuations and flicker

In accordance with the provisions of the EU Guidelines:
73/23/EWG (Guidelines for low voltage electrical equipment)
89/336/EWG (Electromagnetic compatibility)
